                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to methods for stimulating or inhibiting anglogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following process. PRO179, PRO384, PRO844, PRO846, PRO1760, PRO205, PRO311, PRO333, PRO8410, PRO845, PRO885, PRO885 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or anglogenic disorders. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; Immune related disease; diagnosis; antiinflammatory; cardiant; dermatological; antiarthritic; antirheumatic; immunosuppressive; haematological; antithrotd; antidabetic; nootropic; neuroprotective; antianaemic; hepatorropic; virucide; antipsoriatic; antiallergic; antiasthmatic; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; spondyloarthropathy; systemic sclerosis; sarcoidosis; didopathic inflammatory myopathy; systemic sclerosis; sarcoidosis; systemic vasculitis; autoimmune haemolytic anaemia; diabetes mellitus; demyelinating disease; hepatobilary disease; Whipple's disease; demyelinating disease; hepatobilary disease; Whipple's disease; inflammatory bowel disease; gluten-sensitive enteropathy; autoimmune disease; allergic disease; immune-mediated skin disease; allergic disease; immunological disease; transplantation associated disease;

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, such straintius, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Henzel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 KP, Goddard A, Gurney AL, Hebert C, He

Escherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respoises 157-167 of PRO364. PRO364 polypeptides are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells proinflammatory or autoimmune responses in mammalian cells claimed). Chimeric molecules comprising a PRO364 polypeptide immunoglobulin Fc region are also claimed. PRO364 polypeptide immunoglobulin Fc region are also claimed. PRO364 polypeptide interactions. This is useful for identifying inhibitors or assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as

                                                      protein from clone_AB. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Banagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.

20.08 townstring the gracecorticota induced remains necessary and murine gracecorticota induced remains a constitutive for murine gracecore in a T-helper cell library.

TRII activated NF-kappaB through a TRAPZ-mediated mechanism.

TRII activated NF-kappaB through a TRAPZ-mediated mechanism.

Expression is activation-inducible. The TRII ligand is constitutively expressed in an endothelial cell line. This suggests that TRII and its ligand may be involved in activated T-cell trafficking.

The invention provides TRII, TRIISVI and TRIISVZ notels acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and see an autoimment disease, especially remark to reast, proposed encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of human tumour necrosis factor receptor-like protein TR11, a novel 25 kDa protein which shows 58.6% identity to murine glucocorticoid induced tumour necrosis
"conserved domain CD-VII"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..211

The present sequence is a molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA library. This sequence is expressed in cardiovascular and haematopoletic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, hepatotropic, antinflammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antithyroid, thyromimetic, immunosuppressive, osteopathic, antiarthritic, uropathic, antiulcer, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g.
Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  actinic keratosis, arteriosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and

cells This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antiqen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoletic cells, e.g. Imphoid cells which affect immunological responses, e.g. autoimmune disorders. Human 312C2 T cell protein; thymus cell; spleen cell; T cell; antigen-specific T cell proliferation; cytokine production by T-cell; apoptosis; cancer; haematopoietic cells; lymphoid cell; autoimmune disorders. darccrvhttrccrdypgeeccsewdcmcvqpefhcgdpccttcrhhpcppgqgvqsqgk 105 Gaps DARCCRVHTTRCCRDYPGEECCSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGQGVQSQGK 60 FSFGFQCIDCASGTFSGGHEGHCKPWTDCTQFGFLTVFPGNKTHNAVCVPGSPPAEPLG 119 Isolated 312C2 T cell gene - used to develop products for treating, e.g. cancers, auto-immune disorders, transplantation rejection and other T cell disorders ö Length 241; Indels Amino acid sequence of the human 312C2 T cell protein. 100.0%; Score 737; DB 19; 100.0%; Pred. agonists/antagonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, Digeorge syndrome, HIV infection, severe combined immunodeficiency of SCID), Wiskott-Aldrich disorder, blood coagulation disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, haemolytic anaemia, rheumatoid arthritis, Goodpastures syndrome, Grave's systemic lupus erythematosus, Guillain-Barre syndrome, insulin dependent diabetes mellitus or autoimmune inflammatory eye disease, anaphylaxis,
                            receptor-like protein (TRII receptor). The invention relates to TRII and determined by sequencing cloned cDNAS AA27765-237766. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GTRR). TRII, TRIIISVI and TRIISV2 pollypetides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for
                                                                                                                                                                                                                                                                                                                                           hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperscute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections. They can also be diseate, prepair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, encropathies, and central nervous system disease (e.g. Alzhehimer's disease, Parkinson's disease, Huttington's disease, amyotrophic lateral sclerosis, and Shy-Drager syndrome). The products can also be used for

arthritis, systemic lupus erythematosus, thrombocytopenia purpura or IgA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.

ó
                            proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothellal or anglogenic disorders. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; immune related disease; diagnosis; antiinflammatory; cardiant; dermatological; antiarthritic; antirheumatic; immunosuppressive; haemostatic; antithroid; antidiabetic; noctropic; neuroprotective; antianaemic; hepatotropic; virucide; antipsoriatic; antiallergic; antianaemic; hapatotropic; virucide; antipsoriatic; antiallergic; antiasthmatic; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; spondyloarthropathy; systemic sclerosis; sarcoidosis; didopathic inflammatory myopathy; sjogrem's syndrome; thyroiditis; systemic vasculitis; autoimmune haemolytic anaemia; diabetes mellitus; autoimmune disease; hepatobiliary disease; whipple's disease; liflammatory bowel disease; gluten-sensitive enteropathy; autoimmune disease; ilmnune-mediated skin disease; allergic disease; antimunological disease; transplantation associated disease;

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, costeoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic vasculitis, arcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immenia disease, gluten-sensitive enteropathy and whipple's disease, compendent and peripheral nervous systems, hepatobiliary diseases of inflammatory bowel disease, gluten-sensitive enteropathy and whipple's disease, autoimmune con immune-mediated skin diseases, allergic disease, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

AACSBST to AACSBST pepresent PCR primers and hybridisation probes used the isolation of human PRO sequences AACSBST to AACSBST and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                               3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              claimed). Chimeric molecules comprising a PR0364 polypeptide fused to a heterologous sequence such as epitope tag or immunoglobulin Fc region are also claimed. PR0364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PR0364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PR0364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tumour necrosis factor receptor family. The sequence was deduced from a bone marrow CDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO, ESCherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respdies 157-167 of PRO364 pro364 polypeptides are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour necrosis factor receptor homologue - useful for, e.g. modulating apoptosis and NF-KB activation and proinflammatory or autoimmune responses
                                                                                                                                                                                                                 PRO364; tumour necrosis factor receptor; human; apoptosis; inflammation; antiinflammatory; NF-KB activation;

clone, designated as DNA4736-TIOG. It is isolated from human small intestine tissue CDNA library, identified using probes based on the consensus sequence DNA48125, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRR) family of polypeptides. PR0364 sequence also shows homology to members of the TNRR family and mouse GITR protein.

This clone is assigned the ATCC deposit No: 209436. PR0364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PR0555, PR0364 and PR0344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present sequence is the human PRO364 protein, encoded by the cDNA

The invention provides highly conserved TR11, TR118V1 and TR118V2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TR11, TR118V1 and/or TR118V2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, sepecially common variable immunodeficiency, (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency deficiency with hyper IgM. TR118V1 and/or TR118V2 cand/or TR118V2 cand/or diagnose an autoimmune disease, especially rheumatoid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Smith V;

This sequence represents PR0364 polypeptide, which is a human glucocorticoid-induced tumor necrosis factor receptor (hGTTR). The corresponding ligand (hGTTRL), PR015, is given in AAB47056.

PR0364 and PR0175 may be used in a mixture with a cardiovascular, endothelial, anglogenic or anglostatic disorder. The cardiovascular, cardiovascular, endothelial, anglogenic or anglostatic disorder. The PR0364 cDNA sequence was isolated from an expressed sequence tag (EST) receptor (TNRP) family of cDNA fragments derived from human unbilical vein endothelial cells (HUVEC). Administering an effective amount of PR0364 or PR0175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGF_2alpha), trauma, a cancer, or age-related mecular degeneration in a human. The pr0364 or PR0175 is useful for inhibiting anglogenesis induced by PR0364 or PR0175 is useful for inhibiting anglogenesis induced by PR0364 or PR0175 is useful for inhibiting anglogenesis induced by PR0364 or PR0175 is useful for inhibiting anglogenesis induced by PR0364 or PR0175 is useful for an antibody that binds PR0364 or PR0175, or their antagonists, are useful for the enterpention of a retinal case therefore the presence of an elevated from a unmor or a retinal case mention or prevention of a theroselerosis, hypertension, inflammatory creatment or prevention of a theroselerosis, inflammatory creatment or prevention of a hearost-anenyms, are proper and the prostonists.
                          Composition for diagnosing and treating cardiovascular, endothelial and anglogenic disorders, comprises a PRO364 or PRO175 polypeptide -

Thirty three nucleic acids encoding PRO polypeptides which are useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus.

Claim 58; Fig 18; 218pp; English

The present sequence is one of thirty three novel PRO polypeptides.
The PRO polypeptides, anti-PRO antibodies, agonists and antipodies and diagnosing immune related antipodies are useful for treating and diagnosing immune related disorders such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, Systemic sclerosis, idiopathic inflammatory myopathies, Syoren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic demyelinating polyneuropathy, hepatobiliary diseases (such as infectious, autoimmune chronic active hepatitis, primary cirrhosis, granulomatous hepatitis and sclerosing cholangitis), inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's inflammatory bowel disease, gluten-sensitive enteropathy and whipple's diseases, autoimmune or immune-mediated skin diseases (such as such as asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity and urticaria), immunological diseases of the lung (such as eosinophilic pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonias, idiopathic pulmonary fibrosis including graft rejection and graft-versus-host diseases.

The present sequence is that of novel human immunomodulator PR0364 (UNQ319), as deduced from CDNA (see AAF30057) isolated from a small intestine library. PR0364 (26 kDa, pl 6.34) shows sequence homology to mouse GITR protein and may be its human counterpart. The invention provides polynuclectides (see AAF30050-62) encoding novel human PRO proteins (see AAB20108-20) including PR0364. Claimed compositions comprising these proteins or their agonists are useful for increasing inflirration of inflammatory cells into a tissue of a mammal stimulating or enhancing an immune response, or increasing the proliferation of T-lymphocytes in a mammal in response to an antigen. Claimed compositions comprising a PRO polypeptide or its antagonist have the opposite effect. A claimed method for treating an immune related disorder, such as a T cell disorder, involves administering a PRO polypeptide, an agonist antibody or an antagonist network propertied, an agonist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, of uvenile chronic arthritis, spondyloarthropathy, systemic sclerosis, idiopathic inflammatory myopathy, sjoarch's systemic sclerosis, idiopathic inflammatory myopathy, sjoarch's smiltiple sclerosis, idiopathic inflammatory myopathy, sjoarch's smiltiple sclerosis, can antoimmune chronic active hepatitis, primary biliary cirrhosis, autoimmune chronic active hepatitis, primary biliary cirrhosis, granulommatous hepatitis, sclerosing cholangitis, iditematory bowel disease (ulcerative colitis and Crohn's disease), gluten-sensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Godowski PJ, Gurney AL;

                                                                                                                                                                                                                                                                                                                                                                                                              enteropathy, Whipple's disease, (auto)immune-mediated skin diseases (such as bullous skin disease, erythema multiforme and psoriasis), allergic diseases (such as asthma, allergic rhinitis, atopic dermattis, food hypersensitivity and urticaria), immunologic diseases of the lung and transplantation associated diseases (such as graft rejection and graft-versus-host disease) (all calmed). Claimed methods of diagnosing these disorders comprise detecting the level of expression of the PRO gene. Also claimed are a method of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host cells, antibodies, and a method of stimulating the proliferation of I lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human umbilical vein endothelial cell; HUVEC; cardiac hypertrophy; myocardial infarction; PGF_Zalpha; trauma; cancer; anglogenesis; age-related macular degeneration; antibody; periodontal disease;

The present sequence is one of seventeen novel PRO polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, angina, myocardial
                                                                                                                                                                                                                                  Human; PRO; cardiant; antianglogenic; antiarteriosclerotic; hypotensive; vasotropic; antirheumatic; antiarthritic; antiinflammatory; cytostatic; vulnerary; antianginal; gene therapy; cardiovascular disease; endothelial disorder; anglogenic disorder; cancer; periodontal disease; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Seventeen nucleic acids encoding PRO polypeptides which are useful in diagnosis and treatment of cardiovascular, endothelial or angiogenic disorders in a mammal -.

infarctions, thrombophlebitis and lymphangitis. The PRO polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and tissue regeneration. The PRO nucleic acids, polypeptides and anti-PRO antibodies are useful for diagnosing a cardiovascular, endothelial or anglogenic disorder.
                                                                                                                                                                                                                                                                                                                 46 darccrvhttrccrdypgeeccsewdcmcvqpefhcgdpccttcrhhpcppgggygsggk 105

The present sequence is that of human tumour necrosis factor receptor-like protein TRII, a novel 25 kDa protein which shows sequence to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The sequence was deduced from a cDNA clone (see AAA50304) discovered in a T-helper cell library.

TRII activated NF-kappaB through a TRAF2-mediated mechanism.

Expression is activation-inducible. The TRII ligand is constitutively expressed in an endothelial cell line. This suggests that TRII and its ligand may be involved in activated T-cell trafficking. The invention provides TRII, TRISVI and TRIISV2 nucleic acids (see AAA53304-06) and highly conserved encoded proteins (see AAA53304-06) and highly conserved encoded proteins (see AAA53304-06), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/Or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid arthritis
                                                                                                                                                                                                                           /note= "epitope-bearing region" 66..71

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PR0364 polypeptides, e.g. in CHO, escherichia coll or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid responses in mammalian cells are useful for modulating apoptosis, NF-KB activation and proinfilmmanctory or autofinmune responses in mammalian cells (claimed). Chimeric molecules comprising a PR0364 polypeptide fused to a heterologous sequence such as epitope tag or funcation and assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PR0364 and also in therapy, e.g. as

O polypeptides and agonists and antagonists of them, used to and treat cardiovascular, endothelial and anglogenic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to methods for stimulating or inhibiting and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO848, PRO844, PRO846, PRO1760, PRO205, PRO311, PRO331, PRO840, PRO877, PRO877, PRO879, PRO882, PRO885 or PRO887. These proteins were identified by isolating rolls clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or anglogenic disorders. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   X S X E
                                                                                                                                                                              This is the manno acid sequence of the numan tumour necrosis factor two splice variants TRISV1 and TRISV2. The invention relates to TRI1 and two splice variants TRISV1 and TRISV2. The nucleotide sequences were determined by sequencing cloned cDNAS AA23765.23766. The TRI1 receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR).

CRILI, TRISVA and TRISVA polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for agonists/Anadonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, blood capulation disorders, blood cogulation disorders, blood cogulation disorders, blood cogulation disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, had be used to treat heart attacks, strokes, Addison's disease, had be used to treat heart attacks, strokes, Addison's disease, had be used to treat heart attacks, strokes, Addison's disease, had an antigenic molecule, organ rejection or graft of alsease, multiple sclerosis, myasthenia gravis, Stiff wan syndrome, insulin dependent disease, inflammatory conditions, ischemiar-perfusion or diabetes mellitus or autotimmune inflammatory bowel disease, crowned alisease, conditions, ischemiar-perfusion of injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, crommed disease, anaphylaxis, complement-mediated hyperacute rejection, nephrities, cromplement-mediated hyperacute rejection, nephrities, and central nervous syndrome, surgery, inflammatory disease, wardery, disease, and central nervous syndrome, and surgery, inclamed sand central nervous syndrome, and surgery incortices and ce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

cells
             antigen-specific T cell proliferation; cytokine production by T-cell; apoptosis; cancer; haematopoletic cells; lymphoid cell; autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 YPGEECCSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGGGVQSQGKFSFGFQCIDCASGTF 120

The invention provides this mily conserved TRII, TRIISVI and TRIISV2 proteins (see ARYSS879-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful. Trinked agammaglosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, x-linked agammaglobulnemia, severe combined immunodeficiency, X-linked agammaglobulnemia, severe combined immunodeficiency antibudish syndrome or X-linked immunodebulin deficiency with hyper IgM. TRII, TRIISVI and/or TRIISV2 and and/or diagnose an autoimmune disease, especially rheumatoid arthritis, systemic lupus srythematosus, thrombocytopenia purpura or IgA nephropathy. The polypetides, polynuclectides and/or antibudies can be administered to cells in vitro, ex vivo or in polypetides may also be used. Methods forms of the

```
The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune mediated renal disease, demyelinating diseases of the central can peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases, allergic diseases, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

AACSB378 represent PCR primers and hybridisation probes used the isolation of human PRO polynucleotide and protein sequences glven in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Henzel W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gurney AL, Hebert C, He

PRO364 (26 kDa, pi 6.34) shows sequence homology to mouse GITR protein and may be its human counterpart. The invention provides polynucleotides (see AAF30050-62) encoding novel human PRO proceins (see AAB20108-20) including PRO364. Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into

ö
c a tissue of a mammal, stimulating or enhancing an immune
response, or increasing the proliferation of T-lymphocytes in a
mammal in response to an antigen. Claimed compositions comprising
a PRO polypeptide or its antagonist have the opposite effect. A
claimed method for treating an immune related disorder, such as a T
cell disorder, involves administering a PRO polypeptide, an agonist
antibody or an antagonist antibody. The disorder is selected from
systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
invenile chronic arthritis, spondyloarthropathy, systemic sclerosis,
idiopathic inflammatory myopathy, Sjogren's syndrome, systemic
vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune
thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated
cranal disease, demyelinated diseases (such as multiple sclerosis),
autoimmune chronic active hepatitis, primary billary cirrhosis,
granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel
cranal disease, collits and Crohn's disease, jquten-sensitive
enteropathy, Whipple's disease, (auto)immune-mediated skin diseases
(such as bullous skin disease, eartheme multiforme and psoriasis),
claimed methods of diagnosing these diseases (such
as graft rejection and graft-versus-host diseases (such
claimed methods of diagnosing these diseases) (all claimed)
claimed methods of diagnosing these diseases (an emethod
claimed methods of diagnosing these diseases (all method

modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77711 and the exemplification of the present invention.

The present sequence is the human PRO364 protein, encoded by the CDNA clone, designated as DNA47365-1206. It is isolated from human small intestine tissue CDNA library, identified using probes based on the consensus sequence DNA44825, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TMRN) family of polypeptides. PRO364 sequence also shows homology to members of the TMFR family and mouse GITR protein. This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO655, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 YPGEECCSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTF 120

Examples of these disorders include cardiac hypertrophy, trauma. cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial infarctions, thrombophlebitis and lymphangitis. The PRO polypeptides and antagonists are also used to prevent tumour anglogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and antisbue regeneration. The PRO nucleic acids, polypeptides and anti-PRO anglogenic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; angiogenesis-associated protein; PRO; endothelial cell growth; cardiac hypertrophy; cardiovascular disorder; endothelial disorder; angiogenic disorder; atherosclerosis; osteoporosis; hypertension; myocardial infarction; diabetic retinopathy; rheumatoid arthritis; Crohn's disease; psoriasis; endometriosis; ulcer; wound healing; cancer; Alzheimer's disease; Huntington's disease; stroke; drug screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents PR0364 polypeptide, which is a human glucocorticoid-induced tumor necrosis factor receptor (hGTTR). The corticoid-induced tumor necrosis factor receptor (hGTTR). The corresponding ligand (hGTTRL), PR015, is given in AAB47056.

PR0364 and PR0175 may be used in a mixture with a cardiovascular, endothelial, angiogenic or angiostatic disorder. The cardiovascular, andotogenic or angiostatic disorder. The PR0364 cDNA sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor receptor (TNRR) family of polypeptides. The PR0175 cDNA sequence was isolated from a library of cDNA fragments derived from human umbilical vein endothelial cells (HUVEC). Administering an effective amount of PR0364 or PR0175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and trans, a cancer, or age-related macular degeneration in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition for diagnosing and treating cardiovascular, endothelial and angiogenic disorders, comprises a PRO364 or PRO175 polypeptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Administering a therapeutically effective amount of an antibody that blinds PRO364 or PRO175 is useful for inhibiting angiogenesis induced by PRO364 or PRO175 in a human suffering from a tumor or a retinal disorder. PRO364 or PRO175, or their antagonists, are useful for vascular related drug targeting or as therapeutic targets for the treatment or prevention of atherosclerosis, hypertension, inflammatory vasculitides. Reynaud's disease, aneurysms, arterial restenosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thrombophlebitis, tumor angiogenesis, gut protection or regeneration and treatment of lung or liver fibrosis, periodontal diseases, attraction of bone-forming cells, central and peripheral nervous system disease and neuropathies and rheumatoid arthitis.

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO nucleic acid, the recombinant production of a PRO comprising a PRO protein, agonists or antagonists of a PRO protein, additionally encompasses methods of identifying modulators of PRO protein additionally encompasses methods of identifying modulators of PRO comprision or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder or a the expression level of a PRO gene. The invention of angiogenic tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or CR or agonist or antagonist; a retroviral gene therapy vector comprising a PRO nucleic acid; and methods of inhibiting or stimulating endothelial candinistration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO protein, or an agonist or antagonist thereof candinistration of a PRO protein, or an agonist or antagonist thereof agonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as a cardiovascular, ulcers, wounds, cancer, Alzheimer's disease, psoriasis, endommetriosis, ulcers, wounds, cancer, Alzheimer's disease, hutington's alease, retrove DRO nucleic acids, processing architis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, hutington's the endometriosis, ulcers, wounds, are analytic and protein and protein and protein and protein and protein and and an appeared and proteins. disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential therapeutic agents. The present sequence represents a PRO protein of the , Goddard A; Mark MR, Marsters SA; M, Wood WI; New isolated nucleic acid for producing a PRO polypeptide, analyzing genetic disorders and treating cardiovascular, endothelial or angiogenic disorders, such as atherosclerosis, wounds or cancer -N, Gerber H, G J, Kuo SS, Mar Williams PM, KP, Ferrara N, AL, Hillan KJ, Watanabe CK, Wi Claim 69; Fig 54; 293pp; English.

```
This is the amino acid sequence of the truncated human 312C2 T cell protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haemacopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.

The present sequence is one of seventeen novel PRO polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or anglogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, anglna, myocardial

Seventeen nucleic acids encoding PRO polypeptides which are useful in diagnosis and treatment of cardiovascular, endothelial or angiogenic

ö
infarctions, thrombophlebitis and lymphangitis. The PRO polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and tissue regeneration. The PRO nucleic acids, polypeptides and anti-PRO antibodies are useful for diagnosing a cardiovascular, endothelial or anglogenic disorder.
                                                                                                                                                                                                     Gaps

Claimed methods of diagnosing these disorders comprise detecting the level of expression of the PRO gene. Also claimed are a method of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host cells, antibodies, and a method of stimulating the proliferation of T lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PRO364; human; glucocorticoid-induced tumor necrosis factor; recept hGITR; ligand; hGITRL; PRO175; tumour necrosis factor receptor; TNF human umbilitoal vein endothelial cell; HUVEC; cardiac hypertrophy; myocardial infarction; GEC_2alpha; trauma; cancer; anglogenesis; age-related macular degeneration; antibody; periodontal disease; vascular-related drug targeting; atherosclerosis; hypertension; inflammatory vasculitides; Reynaud's disease; aneurysm; arreital restenosis; thrombophlebitis; tumor anglogenesis; lung; liver; fibrosis; neuropathy; rheumatoid arthritis.

```
receptor (TNRFN) family of polypeptides. The profile included to a sequence was isolated from a library of cDNA fragments derived from human umbilical vein endothelial cells (HUVEC). Administering an effective amount of PRO364 or PRO175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGF_2alpha), characterized by the presence of an elevated level of PGF_2alpha), characterized by the presence of an elevated level of PGF_2alpha), characterized by the presence of an elevated level of PGF_2alpha), characterized by the presence of an elevated level of an antibody that binds PRO364 or PRO175 is useful for inhibiting amplogenessis induced disorder. PRO364 or PRO175 in a human suffering from a tumor or a retinal vascular-related drug targeting or as therapeutic targets for the vascular-related drug targeting or as therapeutic targets for the vascular-related drug targeting or as therapeutic targets for the vascular-related drug targeting or as therapeutic targets for the vasculatives, Reynaud's disease, aneurysms, arterial restenosis,
                              Composition for diagnosing and treating cardiovascular, endothelial and angiogenic disorders, comprises a PRO364 or PRO175 polypeptide -
                                                                                                                                                                                                                                                                                                                     endothelial, anglogenic or anglostatic agent for the treatment of a cardiovascular, endothelial, anglogenic or anglostatic disorder. The PRO364 cDNA sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   thrombophlebitis, tumor angiogenesis, gut protection or regeneration and treatment of lung or liver fibrosis, periodontal diseases, attraction of bone-forming cells, central and peripheral nervous system disease and neuropathies and rheumatoid arthritis.
                                                                                                                                                                                          This sequence represents PRO364 polypeptide, which is a human gluco-corticoid-induced tumor necrosis factor receptor (hGITR). The corresponding ligand (hGITRL), PRO175, is given in AAB47056. PRO364 and PRO175 may be used in a mixture with a cardiovascular,
                                                                                                                             Claim 1; Fig 1; 76pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          241 AA;

The present sequence is one of thirty three novel PRO polypeptides. The PRO polypeptides, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, didopathic inflammatory myopathies, Signen's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic demyelinating polyneuropathy or Guillain Barre syndrome, and chronic

Thirty three nucleic acids encoding PRO polypeptides which are useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus

Claim 58; Fig 18; 218pp; English.

inflammatory demyelinating polyneuropathy), hepatobiliary diseases (such as infectious, autoimmune chronic active hepatitis, primary biliary cirrhosis, granulomatous hepatitis and sclerosing cholangitis), inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases (such as bullous skin diseases, erythema multiforme, contact dermatitis, psoriasis), allergic diseases such as asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity and utricaria), immunological diseases of the lung (such as eosinophilic pneumonias, idiopathic pulmonary fibrosis

and hypersensitivity pneumonitis), transplantation associated diseases including graft rejection and graft-versus-host diseases.

The invention provides factor receptor family-related gene. The invention provides highly conserved TRII, TRIISVI and TRIISV2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, X-linked agammaglobulinemia, severe combined immunodeficiency, antsott-Aldrich syndrome or X-linked immunodeficiency with hyper IgM. TRII, TRIISVI and/or TRIISV2 antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or adagnose an autoinmune disease, especially rheumatoid arthitis, systemic lupus erythanatosus, thrombocytopenia purpura arthitolis san be administered to cells in vitro, ex vivo or in polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenesis and cardiovascularisation, modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Goddard A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inappropriate PRO expression such as cardiovascular, endothelial or anglogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorders in mammals -

The present sequence is the human PRO364 protein, encoded by the cDNA clone, designated as DNA47365-1206. It is isolated from human small intestine tissue oDNA library, identified using probes based on the consensus sequence DNA4825, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRR) family of polypeptides. PRO364 sequence also shows homology to members of the TNRR family and mouse GITR protein. This clone is assigned the ATCR deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO655, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                          QQ
                                                                                                                                                                                                                                                                                                                                               The present sequence represents human PRO364, a novel member of the tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA.clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO, Escherichia coll or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid responses; NF-KB activation and proinfilmmatory or autoimmune responses in mammalian cells (claimed). Chimeric molecules comprising a PRO364 polypeptide (ised to a heterologous sequence such as epitope tag or immunoglobulin Fc region are also claimed. PRO364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tumour necrosis factor receptor homologue - useful for, e.g. modulating apoptosis and NF-KB activation and proinflammatory or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to methods for stimulating or inhibiting anglogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO238, PRO364, PRO844, PRO846, PRO1760, PRO205, PRO321, PRO333,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gerritsen ME;

PRO840, PRO877, PRO878, PRO879, PRO882, PRO885 or PRO867. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or angiogenic disorders. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; immune related disease; diagnosis; antiinflammatory; cardiant; dermatological; antiarthritic; antirheumatic; immunosuppressive; haemostatic; antithyroid; antidabetic; nootropic; neuroprotective; antianaemic; hepatotropic; virucide; antipsoriatic; antiallergic; antialsthmatic; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; spondyloarthropathy; systemic solerosis; sarcoidosis; didopathic inflammatory myopathy; systemic solerosis; sarcoidosis; systemic vasculitis; autoimmune haemolytic anaemia; diabetes mellitus; autoimmune thrombocytopaenia; immune-mediated renal disease; demyelinating disease; hepatobiliary disease; Whitpple's disease; inflammatory bowel disease; gluten-sensitive enteropathy; autoimmune disease; ilmnune-mediated skin disease; allergic disease; ilmnune-mediated skin disease; allergic disease; antipuncation associated disease;

This is the amino acid sequence of the human tumour necrosis factor receptor-like protein (TRI) receptor). The invention relates to TRI] and two splice variants TRI] receptor). The invention relates to TRI] and two splice variants TRI] and TRISV2. The nucleotide sequences were determined by sequencing cloned conva AA23765-23766. The TRI] receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR).

CRII], TRISVA and TRISVA polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for agonists/andsponists. The polypeptides, agonists or antagonists can be used for treating immune deficiency disorders, blogerge syndrome, HIV infection, severe combined immunodeficiency conjugation adisease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can be used to treat heart attacks, strokes, Addison's disease, had sorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, had sorders or wounds resulting gravis, Stiff-Man syndrome, insulin dependent disease, multiple sclerosis, myasthenia gravis, Stiff-Man syndrome, insulin dependent disease, inflammatory conditions, ischaemia-reportion or graft versus host disease, inflammatory conditions, ischaemia-reportion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, creaming age, disease, or protect tissue damaged by congenite plastic sugatory, fibrosis, reperfusion injury, peripheral energery, inflammatory syndrome, syndrome, surgery, including cometic plastic surgery, including consentic plastic surgery, including syndrome and syndrome. Syndrome and Shapase, syndrome and shapase, energery includes and syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present sequence is a molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA library. This sequence is expressed in cardiovascular and haematopoletic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, dermatopoletic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, dermatological, antiinflammatory, antipsoriatic, cytostatic, antiasthmatic, and ophthalmological, antidiscrement, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arteriosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Baughn MR;

This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                    antigen-specific T cell proliferation; cytokine production by T-cell; apoptosis; cancer; haematopoletic cells; lymphoid cell; autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 ORPTGGPGCGPGRLLLGTGTDARCCRVHTTRCCRDYPGEECCSEWDCMCVQPEFHCGDPC 60

                                            This is the amino acid sequence of the truncated human 312C2 T cell protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antiger specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.

The present sequence is that of human tumour necrosis factor receptor-like protein TR11, a novel 25 kDa protein which shows 58.6% identity om murine glucocorticoid induced tumour necrosis actor receptor family-related gene. The sequence was deduced from a cobn clone (see AAA50304) discovered in a Thelper cell library.

TR11 activated NF-kappaB through a TRAF2-mediated mechanism.

Expression is activation-inducible. The TR11 ligand is constitutively expressed in an endothelial cell line. This suggests that TR11 and its ligand may be involved in activated T-cell trafficking. The invention provides TR11, TR15V1 and TR118V2 nucleic acids are AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50879-81), as well as vectors, host cells and recombinant methods for their production. TR11, TR118V1 and/or TR15V2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable.immunodeficiency especially common variable.immunodeficiency especially common variable. Immunodeficiency especially common variable. Immunodeficiency especially common variable. TR15V2 cell cells and recombined immunodeficiency activity hyper IgM. TR11, TR118V1 and/or TR118V2 antagonists (e.g. antibodies) are used to treat, prevent, prognose an autoimmune disease, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated aberrant cell survival such as autoimmune disease and rheumatoid

(SCID), Wiskott-Aldrich syndrome or X-linked immunoglobulin deficiency with hyper IgM. TR11, TR11SV1 and/or TR11SV2 antagonists (e.g. antibodies) are used to treat, prevent, prognose
                                                                            arthritis, systemic lupus erythematosus, thrombocytopenia purpura or 1gA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicallular organism. Soluble forms of the polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alzheimer's disease; Parkinson's disease; Huntingdon's disease;

receptor-like protein (TRI) receptor). The invention relates to TRI and two splice variants TRISVI and TRISV2. The invention relates to TRI and two splice variants TRISVI and TRISV2. The nucleotide sequences were determined by sequencing cloned cobasts. TRI receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GTR). TRISVI and TRISV2 polypeptides may be involved in the requiation. TRISVI and TRISV2 polypeptides may be involved in the requiation, and ultimately, cell death. They can be used for screening for agonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating adisease state associated minumodeficiency disorders, bigeorge syndrome, HIV infection, severe combined immunodeficiency (SCID), Wiskott-Aldrich disorder, blood coagulation disorders, blood cagulation disorders, phood platelet disorders or wounds resulting from traume or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, hemmolytic anaemia, rheumatoid arthritis, Goodpastures syndrome, Grave's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disease, multiple sclerosis, myasthenia gravis, Stiff-Man syndrome, systemic lupus erythematosus, Guillain-Barre syndrome, insulin dependent diabetes mellitus or autoimmune inflammatory eye disease, anaphylaxis, hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections. They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager syndrome). The products can also be used for detection, diagnosis and prognosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physicology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells

    used to develop products for treating,
    lisorders, transplantation rejection and

                                                                                                                                                                                                                                                                                                            Region
    ;
                                                             protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Bngagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. Iymphoid cells which affect immunological responses, e.g. autoimmune disorders.

factor receptor family related gene. The sequence was deduced from a CDNA clone (see AAA50304) discovered in a T-helper cell library. TRIL activated NT-Kappab through a TRAF2-mediated mechanism. Expression is activation-inducible. The FRIL ligand is constitutively expressed in an endothelial cell line. This suggests that TRIL and its ligand may be involved in activated T-cell trafficking. The invention provides TRIL, TRIISVI and TRILSVI nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAY56379-81), as well as vectors, host cells and recombinant methods for their production. TRIL, TRIISVI and/or TRIISVI polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency. X-linked agammaglobulinemia, severe combined immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
